Destructoring

- Only one argument per function/method

- No index-Operator []

- No dot-Operator for value-access

- Use **destructoring** instead

Example 1

Instead of

```
function formatProduct(name, price, currency) {

  currency = currency || '$';

  return name + ': ' + currency + price;

}

console.log(formatProduct('Tv', 35));
```

do this:

```
function formatProduct({name, price, currency = '$'}) {

  return name + ': ' + currency + price;

}

formatProduct({name: 'Tv', price: 35});
```

Example 2

Instead of

```
colors = ['blue', 'green'];

let a = colors[0];

                  let b = colors[1];
```

do this:

```
colors = ['blue', 'green'];

let [a, b] = colors;
```
